**B4578BTSA**
Fender Mounting Instructions for MIN4000, MIN900, MIN1500 & MIN1554 Fenders

**STEP 1**

A. Unpack all cartons and lay out parts.

B. Compare the parts with hardware kit B4578BTSA as shown in Figure 1.

**STEP 2**

A. Lay the fenders out and clamp them together (Figure 2). This will make bolting them together much easier.

B. Bolt the fenders together. A pack of 5/16 x 1” bolts, 5/16” nuts and 5/16” x 1- ½” fender washers is included in the kit. **Use four bolts per joint and torque bolts 10-15 ft-lbs.**
STEP 3

A. Measure the suspension travel. This measurement is used to determine the distance between the fender and the wheel.

   a. For air suspension systems, let the air out of the air bags.

   b. For spring systems, measure from the stops on the springs to the bottom of the frame.

NOTE: For air suspensions with travel exceeding 6”:

In some cases a travel stop may need to be installed to prevent such large gaps between fenders & tires. This will help with alignment and 5th wheel plate clearance. *(Please call Minimizer @ 800-248-3855 for questions regarding this issue).*

B. Gap the fenders ¾” over the maximum travel point of the suspension system. The goal is to make sure the fender does not rub on the tire. A gap larger than ¾” may be necessary if using worn tires.

TIP: Establish the minimum gap required in Step 3B.

   a. For an air suspension system, place a ¾” board on top of the tires after the air has been let out of the airbags (Figure 3). Place the fender on top of the board.

   b. For a spring suspension system, add ¾” to the measurement from Step 3A.

STEP 4

A. Position the fenders exactly where they will be mounted.

   a. Visually pick and mark the locations that the brackets will bolt or weld to the frame (depending on mounting kit).

B. Try to use existing holes in the frame to bolt through. It is possible to remove any existing frame bolt and replace it with the supplied bolt in the bracket kit.

   Tip: It is common for the front bracket to align with the existing quarter fender holes and the rear bracket to align with the holes left from the mud flap hanger.
NOTE: Depending on the length of the truck frame and the placement of the mud flap hangers, the fender may tuck inside the mud flap hanger.

NOTE: Do not drill into the weld or any other part of the light box. If a mud flap is mounted to the light box style fender and the mud flap is backed over, it may cause the interior welded plate to become loose. Slot the mud flaps to prevent this issue. This is NOT covered under warranty.

C. Spacers are supplied to bring the steel swivel away from the frame in the event of any obstructions (Figure 4).
   a. The ideal setup is to mount the steel swivel directly to the frame.

NOTE: Use spacers only when necessary.

D. Install center bracket assembly (Figure 5).
   a. Try to use existing holes in the frame to bolt through. It is possible to remove any existing frame bolt and replace it with the supplied bolt in the bracket kit. Recommended torque for the 5/8 x 2-1/2” bolt with washer is 110-115 ft-lbs.

E. Install center bracket as close where the two fenders join together as possible (Figure 6).
   a. Drill three 5/16” holes through the fender using the holes in bracket PB5069 as a guide.
   b. Use three 5/16” x 1 ¼” bolts to bolt the center bracket and fender together.
   c. Use 5/16” fender washers and 5/16” nuts provided with the kit on the inside of the fender. Recommended torque for all 5/16” hardware is 10-15 ft-lbs.
F. Some installations may not allow the center bracket to bolt through the end of the fender.

   a. In these cases use the plastic angle (PB5071) to connect the fender to the center bracket assembly (Figure 7).

   b. Use three 5/16" x 1" bolts, washers, and nuts to bolt PB5071 to the center bracket assembly. Do not tighten these until the fender is level. **Recommended torque is 10-15 ft-lbs.**

   **Tip:** PB5071 is also used as a height adjustment for the end of the fender.

G. Drill four 5/16" holes through the fender using the holes in bracket PB5071 as a guide (Figure 8).

   a. Install the 5/16" x 1 ¼" bolts through the bracket and into the fender.

   b. Use 5/16" fender washers and 5/16" nuts provided with the kit on the underside of the fender.

   c. **Recommended torque for all 5/16" bolts is 10-15 ft-lbs**

H. If possible, position the mounting brackets so they are located within 15" of the bottom of the fender. This protects against wind blowing the leading edge of the fender back into the tire (Figure 9).

   **Tip:** If the front fender bracket is mounted higher than 15", refer to [http://www.minimizer.com/instructions.html](http://www.minimizer.com/instructions.html) for further suggestions on adding additional support.
STEP 5

A. Slide the stainless clamp (part number PB5053) and the mounting tube (part number PB5052) onto the steel swivel (part number PB5015).

Place plastic end cap (PBRDR111069A) into the end of the mounting tube (Figure 10).

Tip: Make sure the slot on the mounting tube is facing down towards the ground.

STEP 6

Once the brackets are placed in position with the fender, securely tighten the 5/8” x 4-1/2” bolts that go through the PB5015 steel swivel to attach the swivel securely to the frame (Figure 11). **Recommended torque is 160-170 ft-lbs.**

STEP 7

Position the tube clamp ¼” away from the end of the stainless tube. **The recommended torque for tightening the stainless clamp is 30 ft. lbs.** Figure 12 shows an over-tightened tube clamp and Figure 13 shows a properly tightened tube clamp. **Over tightening the tube clamp will cause the clamp to make uneven contact and cause the tube to loosen up over time.**
STEP 8

A. Attach the bracket (PB5052) to the fender.

a. Drill six 5/16" holes through the fender using the holes in the fender washers as a guide.

b. Install the 5/16" x 2 ½" x 3 ½" U-bolts through the bracket and into the fender.

c. Use two fender washers per U-bolt.

d. Place one washer on the inside and outside of the fender. Use three U-bolts per fender bracket tube.

e. Make sure the fenders are square and aligned (Figure 14). Twists or bows in the fender will fatigue the material over time.

f. Tighten the U-bolts. **Recommended torque is 75-90 in-lbs. Do not exceed recommended torque.**

STEP 9

A. For trucks with air suspension, raise and lower the suspension one final time to confirm that there is adequate clearance between the fenders and wheels.

B. Recheck all brackets and bolts to ensure they are tightened to the recommended torque.

**NOTE: ONCE FENDERS ARE IN SERVICE, OCCASIONALLY CHECK TORQUE ON THE 5/8" X 4-1/2" HEX BOLTS IN THE FRAME TO MAKE SURE THEY DO NOT LOOSEN OVER TIME.**
