B9900BTSA
Fender Mounting Instructions for MIN1352 & MIN1354 Fenders

STEP 1

A. Unpack all cartons and lay out parts.

B. Compare the parts with hardware kit B9900BTSA as shown in Figure 1.

STEP 2

A. Lay the fenders out and clamp them together (Figure 2). This will make bolting them together much easier.

B. Bolt the fenders together. A pack of 5/16 x 1" bolts, 5/16" nuts and 5/16" x 1-½" fender washers is included in the kit. **Use four bolts per joint and torque bolts 10-15 ft-lbs.**

STEP 3

A. Measure the suspension travel. This measurement is used to determine the distance between the fender and the wheel.
a. For air suspension systems, let the air out of the air bags.

b. For spring systems, measure from the stops on the springs to the bottom of the frame.

**NOTE: For air suspensions with travel exceeding 6”:**

In some cases a travel stop may need to be installed to prevent such large gaps between fenders & tires. This will help with alignment and 5th wheel plate clearance. *(Please call Minimizer @ 800-248-3855 for questions regarding this issue).*

B. Gap the fenders ¾” over the maximum travel point of the suspension system. The goal is to make sure the fender does not rub on the tire. A gap larger than ¾” may be necessary if using worn tires.

**TIP:** Establish the minimum gap required in Step 3B.

a. For an air suspension system, place a ¾” board on top of the tires after the air has been let out of the airbags (Figure 3). Place the fender on top of the board.

b. For a spring suspension system, add ¾” to the measurement from Step 3A.

**STEP 4**

A. Position the fenders exactly where they will be mounted.

a. Visually pick and mark the locations where the brackets will bolt to the frame.

B. Try to use existing holes in the frame to bolt through. It is possible to remove any existing frame bolt and replace it with the supplied bolt in the bracket kit.

**Tip:** It is common for the front bracket to align with the existing quarter fender holes and the rear bracket to align with the holes left from the mud flap hanger.

**NOTE:** Depending on the length of the truck frame and the placement of the mud flap hangers, the fender may tuck inside the mud flap hanger.
C. Spacers are supplied to bring the steel swivel away from the frame in the event of any obstructions (Figure 4).
   a. The ideal setup is to mount the steel swivel directly to the frame.

   **NOTE:** Use spacers only when necessary.

D. If possible, position the mounting brackets so they are located within 15” of the bottom of the fender. This protects against wind blowing the leading edge of the fender back into the tire (Figure 5).

   **Tip:** If the front fender bracket is mounted higher than 15”, refer to [http://www.minimizer.com/instructions.html](http://www.minimizer.com/instructions.html) for further suggestions on adding additional support.

E. Mount the center bracket so that it is directly over the seam where the fenders join together (Figure 6).
STEP 5

A. Slide the stainless clamp (part number PB5053) and the mounting tube (part number PB5052) onto the steel swivel (part number PB5015).

Place plastic end cap (PBRDR111069A) into the end of the mounting tube (Figure 7).

**Tip:** Make sure the slot on the mounting tube is facing down towards the ground.

STEP 6

A. Once the brackets are placed in position with the fender, securely tighten the 5/8” x 4-1/2” bolts that go through the PB5015 steel swivel to attach the swivel securely to the frame (Figure 8). **Recommended torque is 160-170 ft-lbs.**

STEP 7

Position the tube clamp ¼” away from the end of the stainless tube. **The recommended torque for tightening the stainless clamp is 30 ft. lbs.** Figure 9 shows an over-tightened tube clamp and Figure 10 shows a properly tightened tube clamp. **Over tightening the tube clamp will cause the clamp to make uneven contact and cause the tube to loosen up over time.**
STEP 8

A. Attach the bracket (PB5052) to the fender.

   a. Drill six 5/16" holes through the fender using the holes in the fender washers as a guide.

   b. Install the 5/16" x 2 ½" x 3 ½" U-bolts through the bracket and into the fender.

   c. Use two fender washers per U-bolt.

   d. Place one washer on the inside and outside of the fender. Use three U-bolts per fender bracket tube.

   e. Tighten the U-bolts. **Recommended torque is 75-90 in-lbs. Do not exceed recommended torque.**

   f. Make sure the fenders are square and aligned (Figure 11). Twists or bows in the fender will fatigue the material over time.

STEP 9

A. For trucks with air suspension, raise and lower the suspension one final time to confirm that there is adequate clearance between the fenders and wheels.

B. Recheck all brackets and bolts to ensure they are tightened to the recommended torque.

**NOTE: ONCE FENDERS ARE IN SERVICE, OCCASIONALLY CHECK TORQUE ON THE 5/8” X 4-1/2” HEX BOLTS IN THE FRAME TO MAKE SURE THEY DO NOT LOOSEN OVER TIME.**
